# Experiment 2

**Student Name: Tanay Manish Nesari** **UID: 23BCS13761**
**Branch: BE-CSE** **Section/Group: 1-B**
**Semester: 5th** **Date of Performance: 29.7.25**
**Subject Name: ADBMS** **Subject Code: 23CSP-333**

## 1. Aim:

To demonstrate the application of various SQL JOIN operations.

## 2. Objective:

1) You are a Database Engineer at TalentTree Inc., an enterprise HR analytics platform that stores employee data, including their reporting relationships.

The company maintains a centralized Employee relation that holds:_Each employee's ID, name, department, and manager ID (who is also an employee in the same table).
Your task is to generate a report that maps employees to their respective managers, showing:
The employee's name and department
Their manager's name and department (if applicable)
This will help the HR department visualize the internal reporting hierarchy.

2) **Problem Title: NPV Lookup Using LEFT JOIN**

You have two tables:
1. Year_tbl: contains actual NPV (Net Present Value) for different years and IDs.
2. Queries: contains (ID, YEAR) pairs for which you want to find the NPV.
Goal:
Return the queried (ID, YEAR) pairs along with the corresponding NPV value.
If NPV doesn't exist for that (ID, YEAR), show 0.

## 1. DBMS script and output:

1)
```
CREATE TABLE employee (
    EmpID INT fIRIMARY KEY,
    EmpName VARCHAR(50) NOT NULL,
    Department VARCHAR(50) NOT NULL,
    ManagerID INT
);

INSERT INTO employee (EmpID, EmpName, Department, ManagerID) VALUES
(101, 'Alice Smith', 'Engineering', NULL),
(102, 'Bob Johnson', 'Engineering', 101),
(103, 'Charlie Brown', 'HR', 101),
(104, 'David Lee', 'Engineering', 102),
(105, 'Eve Davis', 'HR', 103),
(106, 'Frank White', 'Sales', NULL),
(107, 'Grace Green', 'Sales', 106);

SELECT
    E1.EmpName AS [EMfILOYEE NAME],
    E1.Department AS [EMfl_DEfIARTMENT],
```

```
        E2.EmpName AS [MANAGER NAME],
        E2.Department AS [MANAGER_DEPARTMENT]
    FROM
        employee AS E1
LEFT OUTER JOIN
        employee AS E2 ON E1.ManagerID = E2.EmpID;
```
